

## Tested by KOAC

The solvent free and coal tar free **Boligrip®** wearing course from Bolidt on the A15 motorway has shown remarkable results. This wearing course was applied on top of the concrete upper layer of the Oude Pernissegweg fly-over in Rotterdam. Due to heavy lorry traffic the original top layer on the outside curve had become so smooth that road safety could no longer be guaranteed.

The Boligrip® wearing course was received with open arms; not only was it processed within a short time by Bolidt's own specialists, the ultimate properties also proved to be satisfactory. Especially the grip, measured by KOAC with slipping wheels, is many times better than that of the surrounding combination top surface. With a value of 0.65 – 0.75 compared to 0.40 – 0.55, Bolidt has every reason to be proud of the results.

It makes you wonder why all the other fly-overs that have to deal with heavy lorry traffic have not yet been resurfaced with this durable wearing course.
